

Remote Access Report

Purpose

This document explains how mobile staff and maintenance contractors can access applications without compromising security.

Mobile Staff

Mobile staff use SSL VPN on FortiGate-HQ. Access is protected with MFA and assigned to the Mobile-Staff group.

Recommended controls:

Control	Reason
MFA	Prevents password-only compromise
Named user accounts	Provides accountability
SSL VPN portal	Controlled remote access
Role-based policies	Limits users to required systems
Logging	Supports audit and incident response

Access path:

Mobile Staff -> FortiGate-HQ SSL VPN -> Approved internal applications

Maintenance Contractors

Contractors use a separate Maintenance-Contractors VPN group. They should not access production networks directly.

Access path:

Contractor -> FortiGate-HQ SSL VPN -> Management Jump Host -> Approved target system

Controls:

Control	Reason
Separate contractor group	Isolates contractor permissions
Jump host	Prevents direct access to production systems
Time-limited accounts	Access expires after the work window
Least privilege firewall policy	Allows only required ports
Logging / session monitoring	Provides audit evidence

Security Summary

The design protects Electric Petrol because public access is limited to DMZ VIPs, remote access is authenticated, contractor access is restricted to a jump host, and internal LANs are not directly exposed.
